

Using a non-preferred provider in a tiered network plan can also have significant financial ramifications for patients. When patients receive care from an out-of-network provider, they may be subject to staggering out-of-pocket costs, either in the form of high copayments for out-of-network services or "balance billing."

Although the ACA prohibits insurers from charging additional copayments for out-of-network emergency department care, these protections do not prevent balance billing by physicians.<sup>5</sup> Balance billing occurs when out-of-network providers bill consumers for the portion of their charges not paid by the insurer. These "surprise" medical bills are a significant cause for consumer concern. A survey by [redacted] found that 44% of respondents received a bill where their plan paid much less than expected or nothing and of those who received a surprise medical bill nearly half (48%) had to pay more than \$1,000.<sup>6</sup>

- Require states to set quantitative standards for measuring network adequacy;
- Require prior approval of insurance company network access plans;
- Comprehensively address the issue of surprise medical bills;
- Ensure strong continuity of care protections for patients with chronic health conditions who lose access to their health care providers due to network changes or switching plans; and
- Ensure that network provider directories are updated at least monthly. Directories should be accurate and easily accessible, and health plans should hold consumers harmless when directories are inaccurate.
